

Algorithm

Lecture #12

Syed Hamed Raza

Heap

Heap

- The number of nodes in a complete binary tree of height h is

- $n = 2^0 + 2^1 + 2^2 + \dots + 2^h$

$$= \sum_{i=0}^h 2^i = 2^{h+1} - 1$$

- h in terms of n is

$$h = (\log(n + 1)) - 1 \approx \log n \in \Theta(\log n)$$

Heap

Heap

- One of the clever aspects of heaps is that they can be stored in arrays without using any pointers.
- This is due to the left-complete nature of the binary tree.
- We store the tree nodes in level-order traversal.

Heap

Heap

Access to nodes involves simple arithmetic operations:

- $\text{left}(i)$: returns $2i$, index of left child of node i .
- $\text{right}(i)$: returns $2i + 1$, the right child.
- $\text{parent}(i)$ returns $\lfloor i/2 \rfloor$, the parent of i .

Heap sort Algorithm

Heapsort Algorithm

- We build a max heap out of the given array of numbers $A[1..n]$.
- We repeatedly extract the the maximum item from the heap.
- Once the max item is removed, we are left with a hole at the root.
- To fix this, we will replace it with the last leaf in tree.

Heap sort Trace

Heap Sort

HEAPSORT(array A, int n)

1 BUILD-HEAP(A, n)

2 $m \leftarrow n$

3 **while** ($m \geq 2$)

4 **do** SWAP(A[1],A[m])

5 $m \leftarrow m - 1$

6 HEAPIFY(A, 1,m)

Heapify

Heapify

HEAPIFY(array A, int i, int n)

1 $l \leftarrow \text{LEFT}(i)$

2 $r \leftarrow \text{RIGHT}(i)$

3 $\text{max} \leftarrow i$

4 **if** ($l \leq m$) and ($A[l] > A[\text{max}]$)

5 **then** $\text{max} \leftarrow l$

6 **if** ($r \leq m$) and ($A[r] > A[\text{max}]$)

7 **then** $\text{max} \leftarrow r$

Heapify

Heapify

```
3  max  $\leftarrow$  i
4  if ( $l \leq m$ ) and ( $A[l] > A[\text{max}]$ )
5    then max  $\leftarrow$  l
6  if ( $r \leq m$ ) and ( $A[r] > A[\text{max}]$ )
7    then max  $\leftarrow$  r
8  if (max  $\neq$  i)
9    then SWAP( $A[i], A[\text{max}]$ )
10 HEAPIFY( $A, \text{max}, m$ )
```

Analysis of Heapify

Analysis of Heapify

- We call heapify on the root of the tree.
- The maximum levels an element could move up is $\Theta(\log n)$ levels.
- At each level, we do simple comparison which $O(1)$.
- The total time for heapify is thus $O(\log n)$.
- Notice that it is not $\Theta(\log n)$ since, for example, if we call heapify on a leaf, it will terminate in $\Theta(1)$ time.

Analysis of BuildHeap

Analysis of BuildHeap

- For convenience, we will assume $n = 2^{h+1} - 1$ where h is the height of tree..
- The heap is a left-complete binary tree.
- Thus at each level j , $j < h$, there are 2^j nodes in the tree.
- At level h , there will be 2^h or less nodes.
- How much work does buildHeap carry out?

BuildHeap

BuildHeap

Total work performed

Analysis of BuildHeap

Analysis of BuildHeap

- At the bottom most level, there are 2^h nodes but we do not heapify these.
- At the next level up, there are 2^{h-1} nodes and each might shift down 1.
- In general, at level j , there are 2^{h-j} nodes and each may shift down j levels.

Analysis of BuildHeap

Analysis of BuildHeap

- So, if count from bottom to top, level-by-level, the total time is

$$T(n) = \sum_{j=0}^h j 2^{h-j} = \sum_{j=0}^h j \frac{2^h}{2^j}$$

- We can factor out the 2^h term:

$$T(n) = 2^h \sum_{j=0}^h \frac{j}{2^j}$$

Analysis of BuildHeap

Analysis of BuildHeap

- How do we solve this sum? Recall the geometric series, for any constant $x < 1$

$$\sum_{j=0}^{\infty} x^j = \frac{1}{1-x}$$

- Take the derivative with respect to x and multiply by x

$$\sum_{j=0}^{\infty} jx^{j-1} = \frac{1}{(1-x)^2} \quad \sum_{j=0}^{\infty} jx^j = \frac{x}{(1-x)^2}$$

Analysis of BuildHeap

Analysis of BuildHeap

- We plug $x = 1/2$ and we have the desired formula:

$$\sum_{j=0}^{\infty} \frac{j}{2^j} = \frac{1/2}{(1 - (1/2))^2} = \frac{1/2}{1/4} = 2$$

Analysis of BuildHeap

Analysis of BuildHeap

- In our case, we have a bounded sum, but since the infinite series is bounded, we can use it as an easy approximation:

$$\begin{aligned} T(n) &= 2^h \sum_{j=0}^h \frac{j}{2^j} \\ &\leq 2^h \sum_{j=0}^{\infty} \frac{j}{2^j} \\ &\leq 2^h \cdot 2 = 2^{h+1} \end{aligned}$$

Analysis of BuildHeap

Analysis of BuildHeap

- Recall that $n = 2^{h+1} - 1$.
- Therefore

$$T(n) \leq n + 1 \in O(n)$$

- The algorithm takes at least $\Omega(n)$ time since it must access every element at once.
- So the total time for BuildHeap is $\Theta(n)$.

Analysis of BuildHeap

Analysis of BuildHeap

- BuildHeap is a relatively complex algorithm.
- Yet, the analysis yield that it takes $\Theta(n)$ time.
- An intuitive way to describe why it is so is to observe an important fact about binary trees
- The fact is that the vast majority of the nodes are at the lowest level of the tree.

Analysis of BuildHeap

Analysis of BuildHeap

- The number of nodes at the bottom three levels alone is

$$2^h + 2^{h-1} + 2^{h-2} = \frac{n}{2} + \frac{n}{4} + \frac{n}{8} = \frac{7n}{8} = 0.875n$$

- Almost 90% of the nodes of a complete binary tree reside in the 3 lowest levels.
- Thus, algorithms that operate on trees should be efficient (as BuildHeap is) on the bottom-most levels since that is where most of the weight of the tree resides.

Analysis of Heapsort

Analysis of Heapsort

- Heapsort calls BuildHeap once. This takes $\Theta(n)$.
- Heapsort then extracts roughly n maximum elements from the heap.
- Each extract requires a constant amount of work (swap) and $O(\log n)$ heapify.
- Heapsort is thus $O(n \log n)$.

Analysis of Heapsort

Analysis of Heapsort

- Is HeapSort $\Theta(n \log n)$?
- The answer is yes.
- In fact, later we will show that comparison based sorting algorithms can not run faster than $\Omega(n \log n)$.
- Heapsort is such an algorithm and so is Mergesort that we saw earlier.
