Greedy Algorithms: Activity Selection

Greedy Algorithms: Activity Selection

Here is a simple greedy algorithm that works:

- Sort the activities by their finish times.
- Select the activity that finishes first and schedule it.
- Then, among all activities that do not interfere with this first job, schedule the one that finishes first, and so on.

Greedy Algorithms: Activity Selection

Greedy Algorithms: Activity Selection

SCHEDULE($a[1..N]$)

1 sort $a[1..N]$ by finish times

2 $A \leftarrow \{a[1]\}$; // schedule activity 1
first

3 $prev \leftarrow 1$; // most recently scheduled

4 **for** $i = 2$ to N

5 **do if** ($a[i].start \geq a[prev].finish$)

6 **then** $A \leftarrow A \cup a[i]$; $prev \leftarrow i$

Greedy Algorithms: Activity Selection

Greedy Algorithms: Activity Selection

Correctness of greedy activity selection

- Our proof of correctness is based on showing that the first choice made by the algorithm is the best possible.
- And then using induction to show that the algorithm is globally optimal.

Greedy Activity Selection

Correctness

Greedy Activity Selection Correctness

Correctness of greedy activity selection

- The proof structure is noteworthy because many greedy correctness proofs are based on the same idea.
- Show that any other solution can be converted into the greedy solution without increasing the cost.

Greedy Activity Selection

Correctness

Greedy Activity Selection Correctness

Claim:

- Let $S = \{a_1, a_2, \dots, a_n\}$ of n activities, sorted by increasing finish times, that are to be scheduled to use some resource.
- Then there is an optimal schedule in which activity a_1 is scheduled first.

Greedy Activity Selection

Correctness

Greedy Activity Selection Correctness

Proof:

- Let A be an optimal schedule.
- Let x be the activity in A with the smallest finish time.
- If $x = a_1$ then we are done.
- Otherwise, we form a new schedule A' by replacing x with activity a_1 .

Greedy Algorithms: Activity Selection

Greedy Algorithms: Activity Selection

Greedy Activity Selection

Correctness

Greedy Activity Selection Correctness

Proof:

- We claim that $A' = A - \{x\} \cup \{a_1\}$ is a feasible schedule, i.e., it has no interfering activities.
- This because $A - \{x\}$ cannot have any other activities that start before x finishes, since otherwise, these activities will interfere with x .

Greedy Activity Selection

Correctness

Greedy Activity Selection Correctness

Proof:

- Since a_1 is by definition the first activity to finish, it has an earlier finish time than x .
- Thus a_1 cannot interfere with any of the activities in $A - \{x\}$.
- Thus, A' is a feasible schedule.
- Clearly A and A' contain the same number of activities implying that A' is also optimal.

Greedy Activity Selection

Correctness

Greedy Activity Selection Correctness

Claim: The greedy algorithm gives an optimal solution to the activity scheduling problem.

Proof:

- The proof is by induction on the number of activities.
- For the basis case, if there are no activities, then the greedy algorithm is trivially optimal.

Greedy Activity Selection Optimal

Greedy Activity Selection Optimal

Proof:

- For the induction step, let us assume that the greedy algorithm is optimal on any set of activities of size strictly smaller than $|S|$ and we prove the result for S .
- Let S' be the set of activities that do not interfere with activity a_1 , That is
$$S' = \{a_i \in S \mid s_i \geq f_1\}$$

Greedy Activity Selection Optimal

Greedy Activity Selection Optimal

Proof:

- Any solution for S' can be made into a solution for S by simply adding activity a_1 , and vice versa.
- Activity a_1 is in the optimal schedule (by the above previous claim).

Greedy Activity Selection Optimal

Greedy Activity Selection Optimal

Proof:

- It follows that to produce an optimal schedule for the overall problem, we should first schedule a_1 and then append the optimal schedule for S' .
- But by induction (since $|S'| < |S|$), this exactly what the greedy algorithm does.

Activity Selection

Greedy Algorithms: Activity Selection

Greedy Algorithms: Activity Selection

$A = \{X\} + \{a_1\}$

Greedy Algorithms: Activity Selection

Greedy Algorithms: Activity Selection

```
3 prev ← 1; // most recently scheduled
4 for i = 2 to N
5 do if (a[i].start ≥ a[prev].finish)
6     then A ← A ∪ a[i]; prev ← i
```

Time is dominated by sorting of the activities by finish times. Thus the complexity is $O(N \log N)$.
